Inheritance

C++ Programming Languages, CSE, NTOU, Taiwan

Inheritance

https://www.geeksforgeeks.org/inheritance-in-c/?ref=lbp

- Get rid of duplication of the same codes.
- Decrease the chance of error.
- Increase code and data reusability.
- Abstraction + Hierarchy Class Vehicle Class Class Class Track Car Bus Class Class Class Truck Car Bus derived (衍生) derived (衍生) derived (衍生)

base (基底)

An Easy Illustrating Example

Modes of Inheritance

Just like going through a mask...

• Public

Example: https://onlinegdb.com/Z7tf4BU0x

- public member of the base class => public in the derived class.
- protected members of the base class => protected in derived class.
- private members of the base class => not accessible.
- Protected
 - public member of the base class => protected in the derived class.
 - protected members of the base class => protected in derived class.
 - private members of the base class => not accessible.
- Private
 - public member of the base class => private in the derived class.
 - protected members of the base class => private in derived class.
 - private members of the base class => not accessible.

Single Inheritance

#include<iostream>
using namespace std;

```
class Vehicle {
public:
    Vehicle() {
        cout << "This is a Vehicle.\n";
    }
};
class Car : public Vehicle {
// nothing to do here so far...
};</pre>
```

{

```
// invoke the constructors
Car obj;
return 0;
```

Output:

This is a Vehicle.

ming Languages, CSE, NTOU, Taiwan

Multiple Inheritance

```
#include<iostream>
                                          class Car : public Vehicle, public FourWheeler {
                                              // nothing to do here so far...
using namespace std;
                                          };
class Vehicle {
public:
   Vehicle() {
                                                                          Class
                                                                                      Class
      cout << "This is a Vehicle.\n";</pre>
                                                                         Vehicle
                                                                                   FourWheeler
};
class FourWheeler {
public:
    FourWheeler() {
                                                                                Class
                                          int main()
        cout << "This is a 4 wheeler
                                                                                 Car
                                           {
                 Vehicle.\n";
                                              // invoke the constructors
                                              Car obj;
};
                                              return 0;
                                       This is a Vehicle.
                           Output:
                                       This is a 4 wheeler Vehicle.
                           C++ Programmi
                                                                                            10
```

Multilevel Inheritance

```
#include<iostream>
using namespace std;
```

```
class Vehicle {
public:
    Vehicle() {
        cout << "This is a Vehicle.\n";
    }
};
class FourWheeler: public Vehicle {
public:
    FourWheeler() {
        cout << "A 4 wheeler Vehicle.\n";
    }
};</pre>
```

Output: A 4 wheeler Vehicle. A Car has 4 Wheels.

More Details in Examples

• https://www.programiz.com/cpp-programming/public-protected-private-inheritance

Class Exercise (1%)

```
class Shape {
public:
                                       {
    string type;
protected:
    double parameter;
};
class Circle : protected Shape {
private:
    double area = 0.0;
public:
   void compute area()
/* please implement this member function */
   void setRadius()
/* please implement this member function */
    double getArea() {
/* please implement this member function */
};
```

```
int main()
```

```
Circle obj;
obj.setRadius();
obj.compute area();
cout << "Area: " << obj.getArea();</pre>
return 0;
```

Sample Input & Output:

3.2 Area: 32.1699

Exercise

```
class A {
public:
    int x = 0;
    int get_pvt() { return z; }
protected:
    int y = 1;
private:
    int z = 2;
};
class B : public A {
    // x is public
    // y is protected
    // z is not accessible from B
};
```

Please modify the code here by "adding appropriate member functions" in the the classes B, C, and D.

```
class C : protected A {
    // x is protected
    // y is protected
    // z is not accessible from C
};
class D : private A {
    // 'private' is default for classes
        // x is private
        // y is private
        // y is private
        // z is not accessible from D
};
```

int main () {
 B obj1;
 C obj2;
 D obj3;
 cout << obj1.x << obj2.y << obj3.y;
 // try to print these values
 // by adding appropriate member
 // functions
}</pre>
