Threaded Binary Trees

Issue

there are more null links than actual points.

- Number of nodes: n.
- Number of null non-null links: n-1.
- Number of null links: n + 1.

root

Threaded Binary Trees

Issue

there are more null links than actual points.

- Number of nodes: n.
- Number of null non-null links: n 1.
- Number of null links: n + 1.

Solution

Replace the NULL Links by pointers, threads, pointing to other nodes.

Joseph C. C. Lin (CSE, NTOU, TW)

Threaded Binary Tree + Heaps

< 4 ►

Solution

Replace the NULL Links by pointers, threads, pointing to other nodes.

Threading Rules

- if ptr->leftChild is NULL, then ptr->leftChild = inorder predecessor (中序前行者) of ptr.
- if ptr->rightChild is NULL, then ptr->rightChild = inorder successor (中序後續者) of ptr.

To distinguish between normal pointers and threads

• Two additional fields of the node structure: left-thread, right-thread.

```
typedef struct threadedTree *threadedPointer;
typedef struct threadedTree {
    short int leftThread;
    threadedPointer leftChild;
    char data;
    threadedPointer rightChild;
    short int rightThread;
};
```

 leftThread
 leftChild
 data
 rightChild
 rightThread

Joseph C. C. Lin (CSE, NTOU, TW)

Rules of the Threading Fields

- If ptr->leftThread == TRUE, ptr->leftChild contains a thread; Otherwise, the node contains a pointer to the left child.
- If ptr->rightThread == TRUE, ptr->righChild contains a thread; Otherwise, the node contains a pointer to the right child.

Joseph C. C. Lin (CSE, NTOU, TW)

Rules of the Threading Fields

- If ptr->leftThread == TRUE, ptr->leftChild contains a thread; Otherwise, the node contains a pointer to the left child.
- If ptr->rightThread == TRUE, ptr->righChild contains a thread; Otherwise, the node contains a pointer to the right child.

Two dangling threads at node H and G.
 ⇒ Use a header node to collect them!

Joseph C. C. Lin (CSE, NTOU, TW)

Threaded Binary Tree + Heaps

Fall 2024

• The original tree becomes the left subtree of the head node.

Representing an Empty Binary Tree

Finding the Inorder Successor of Node

```
threadedPointer insucc(threadedPointer tree) {
    /* find the inorder sucessor of tree in a threaded
    binary tree */
    threadedPointer temp;
    temp = tree->rightChild;
    if (!tree->rightThread) // rightChild exists!
        while (!temp->leftThread)
            temp = temp->leftChild;
    return temp;
}
```

To perform an inorder traversal, we can simply make repeated calls to insucc!

Joseph C. C. Lin (CSE, NTOU, TW)

< □ > < □ > < 三 > <

Inorder Traversal of a Threaded Binary Tree

```
void traverseInorder(threadedPointer tree) {
  /* traverse the threaded binary tree inorder */
    threadedPointer temp = tree;
    while (1) {
        temp = insucc(temp);
        if (temp == tree)
            break;
        printf("%3c", temp->data);
    }
}
```

Heaps

Max Tree

A max tree is a tree in which

 \bullet the key value in each node \geq the key values in its children.

< ロ > < 回 > < 回 > <

Heaps

Max Tree

A max tree is a tree in which

• the key value in each node \geq the key values in its children.

Min Tree

A min tree is a tree in which

• the key value in each node \leq the key values in its children.

< □ > < 同 > < 三 > <

Heaps

Max Tree

A max tree is a tree in which

• the key value in each node \geq the key values in its children.

Min Tree

A min tree is a tree in which

• the key value in each node \leq the key values in its children.

Max Heap

A complete binary tree that is also a max tree.

Min Heap

A complete binary tree that is also a min tree.

Joseph C. C. Lin (CSE, NTOU, TW)

(日)

Examples: Max & Min Trees

Examples: Max & Min Heaps

The Key Application: Priority Queues

- Heaps are frequently used to implement priority queues.
- In this kind of queue,
 - the element to be deleted is the one with highest (or lowest) priority.
 - at **any time**, an element with **arbitrary priority** can be **inserted** into the queue.

Insertion into a Max Heap

- The bubbling process.
 - It begins at the new node of the tree and moves toward the root.

Joseph C. C. Lin (CSE, NTOU, TW)

< □ > < □ > < □ > < □ > <</p>

Insertion into a Max Heap

- The bubbling process.
 - It begins at the new node of the tree and moves toward the root.

Insertion into a Max Heap

• The bubbling process.

• It begins at the new node of the tree and moves toward the root.

The Code for Insertion into a Max Heap

• Consider the following declarations:

```
#define MAX_ELEMENTS 200 /* maximum heap size+1 */
#define HEAP_FULL (n) (n == MAX_ELEMENTS -1)
#define HEAP_EMPTY (n) (!n)
typedef struct {
    int key;
    /* other fields */
} element;
element heap[MAX_ELEMENTS];
int n = 0;
```

Joseph C. C. Lin (CSE, NTOU, TW)

< □ > < □ > < □ > < □ > < □ > < □ </p>

The Code for Insertion into a Max Heap

```
void push (element item, int *n) {
/* insert item into a max heap of current size *n */
    int i;
    if (HEAP_FULL(*n)) {
        printf("The heap is full.\n");
        exit(EXIT FAILURE);
    } // (1) time
    i = ++(*n);
    while ((i != 1) && (item.key > heap[i/2].key)) {
       heap[i] = heap[i/2];
        i /= 2:
    } // O(lq n) time
   heap[i] = item; // O(1) time
```

• The time complexity of the insertion: O(lgn).

Joseph C. C. Lin (CSE, NTOU, TW)

Threaded Binary Tree + Heaps

Deletion from a Max Heap

• When an element is to be deleted from a max heap, it is ALWAYS taken from the root of the heap.

Joseph C. C. Lin (CSE, NTOU, TW)

Threaded Binary Tree + Heaps

Fall 2024

Deletion from a Max Heap

- When an element is to be deleted from a max heap, it is ALWAYS taken from the root of the heap.
- The steps of deletion from a Max heap:
 - delete the root node.
 - insert the last node into the root.
 - use the bubbling up process to ensure that the resulting heap remains a max heap.

Illustration of Deletion from a Max Heap

Joseph C. C. Lin (CSE, NTOU, TW)

Threaded Binary Tree + Heaps

Fall 2024

Illustration of Deletion from a Max Heap

The Code for Deletion from a Max Heap

```
element pop(int *n) {
/* delete element with the highest key from the heap */
    int parent. child:
    element item. temp:
    if (HEAP_EMPTY(*n)) {
        fprintf(stderr, "The heap is empty\n");
        exit(EXIT FAILURE):
    /* save value of the element with the highest key */
    item = heap[1]:
    /* use last element in heap to adjust heap */
    temp = heap[(*n)--];
    parent = 1;
    child = 2:
    while (child <= *n) { // O(lg n) time
    /* find the larger child of the current parent */
        if ((child < *n) && (heap[child].kev < heap[child+1].kev))
            child++:
        if (temp.key >= heap[child].key) break;
        /* move to the next lower level */
        heap[parent] = heap[child];
        parent = child;
        child *= 2:
    heap[parent] = temp;
    return item;
```

Joseph C. C. Lin (CSE, NTOU, TW)

Fall 2024

A D M A A A M M

Time Complexity of the Deletion from a Max Heap

- Delete the root node: O(1).
- Insert the last node to the root: O(1).
- Since the height of the heap is $\lceil \lg(n+1)) \rceil$, the while loop is iterated for $O(\lg n)$ times.
- Thus, the overall time complexity: the time complexity of the deletion: $O(\log n)$.
