

Preliminaries

Set

◦ x : element

x in Set A : $x \in A$

x is not in Set A : $x \notin A$

◦ $\{1, 2, 3, 4\} = \{1, 3, 2, 4\} = \{1, 4, 2, 3\} = \dots$

◦ empty set: $\{\}$ or \emptyset

◦ number of elements in A :

另一种集合表示法

cardinality, $|A|$

$\Rightarrow A = \{x \mid x \geq 3 \text{ and } x \in \mathbb{Z}\}$

$\mathbb{N}, \mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}$

Subset

◦ A, B are two sets such that

for any $\forall x \in A \Rightarrow x \in B$

\exists : there exists

Then A is a subset of B

That is, $A \subseteq B$ or $B \supseteq A$

note: $A \not\subseteq B$

$A \not\supseteq B, A \not\subset B$

Operations on Sets

for sets A, B ,

• $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$
"intersection"

• $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$
"union"

• $A - B = \{x \mid x \in A \text{ and } x \notin B\}$
"difference"

• $\bar{A} = \{x \mid x \notin A\}$
"complement"

Example:

Suppose $U = \{1, 2, \dots, 9, 10\}$

$A = \{1, 2, 3, 4\} \subseteq U$

$B = \{3, 4, 5, 6\} \subseteq U$

Then

(1) $A \cap B = \{3, 4\}$

(2) $A \cup B = \{1, 2, 3, 4, 5, 6\}$

(3) $A - B = \{1, 2\}$

(4) $\bar{A} = \{5, 6, 7, 8, 9, 10\}$

Try to test these
in Python

Suppose A_1, A_2, \dots, A_n are n sets.

$$\bigcap_{i=1}^n A_i = A_1 \cap A_2 \cap A_3 \cap \dots \cap A_n$$
$$= \{x \mid x \in A_i, \text{ for all } i = 1, 2, \dots, n\}$$

$$\bigcup_{i=1}^n A_i = A_1 \cup A_2 \cup \dots \cup A_n$$
$$= \{x \mid x \in A_i, \text{ for some } i = 1, 2, \dots, n\}$$

Cartesian product (卡氏積)

Sets A, B

$$A \times B = \{(a, b) \mid a \in A, b \in B\}$$

↳ ordered pair (有序數對)

Function

A, B : sets

$$f: A \rightarrow B$$

$$x \mapsto f(x)$$

unique

A : domain of f 定义域

B : codomain of f 对应域

$$\text{if } S \subseteq A, f(S) = \{f(x) \mid x \in S\}$$

$$\text{if } S' \subseteq B, f^{-1}(S') = \{x \in A \mid f(x) \in S'\}$$

$$* f(A) = \{f(x) \mid x \in A\} : \text{range of } f \text{ (值域)}$$

Example:

$$f: [-5, 5] \rightarrow \mathbb{R}, f(x) = x^2$$

$$\text{range of } f: [0, 25]$$

$$\text{if } S = [1, 3], \text{ then } f(S) = [1, 9]$$

$$\text{if } S' = [4, 9], \text{ then } f^{-1}(S') = [-3, -2] \cup [2, 3]$$

One-to-One / Onto 证明

Suppose $f: A \rightarrow B$ is a function

(1) if $f(x) = f(y) \Rightarrow x = y$

then f is "one-to-one"

(2) if $f(A) = B$,

then f is "onto"

$\forall y \in B, \exists x \in A, \text{ s.t. } f(x) = y$

note

One-to-One : injection

Onto : surjection

and \rightarrow bijection

Example :

$f: [-1, 1] \rightarrow [0, 1], f(x) = x^2$

Since $f(-1) = f(1) = 1$, f is ~~Not one-to-one~~

Composition 函數合成

Suppose $f: A \rightarrow B$, $g: B \rightarrow C$ are two functions

Then $g \circ f: A \rightarrow C$ is defined as

$$(g \circ f)(x) = g(f(x))$$

Example: $f(x) = x^2$, $g(x) = e^x$

$$f: \mathbb{R} \rightarrow \mathbb{R}, g: \mathbb{R} \rightarrow \mathbb{R}$$

$$(g \circ f)(x) = g(f(x)) = g(x^2) = e^{x^2}$$

$$(f \circ g)(x) = f(g(x)) = f(e^x) = e^{2x}$$

Invertible function 可逆函數

Suppose $f: A \rightarrow B$ is a function

if $\exists g: B \rightarrow A$ such that

$$g \circ f = I_A \text{ and } f \circ g = I_B$$

Then f is invertible

$$I_A: A \rightarrow A \text{ such that } I_A(x) = x, \forall x \in A$$

f is an invertible function

$\Rightarrow f$ is one-to-one and onto

note: $(f^{-1})^{-1} = f$, f^{-1} is also invertible

Example

$$f: \mathbb{R} \rightarrow \mathbb{R}, f(x) = 2x + 3$$

$\Rightarrow f$ is one-to-one and onto. (check.)

$$f^{-1}: \mathbb{R} \rightarrow \mathbb{R}$$

$$f^{-1}(x) = \frac{x-3}{2}$$

$$\text{Let } 2x+3 = y$$

$$\Rightarrow x = \frac{y-3}{2}$$

Field 體 examples: $\mathbb{R}, \mathbb{R}^2, \mathbb{C}, \mathbb{C}^2, \dots$

Suppose F is a set, and we define / have addition and multiplication operations on F ,

such that

(1) $\forall a, b \in F, a+b \in F$ 加/乘法封閉性
and $a \cdot b \in F$

(2) $\forall a, b \in F, a+b = b+a$ and $a \cdot b = b \cdot a$
加/乘法交換性

(3) $\forall a, b, c \in F, (a+b)+c = a+(b+c)$
and $(a \cdot b) \cdot c = a \cdot (b \cdot c)$ 加/乘法結合律

(4) $\exists 0, 1 \in F$ such that
 $\forall a \in F, 0+a = a$ 加/乘法單位元素
and $1 \cdot a = a$

(5) $\forall a \in F, \exists b \in F$ such that $a+b=0$ 加法反元素

(6) $\forall a \in F, a \neq 0, \exists b \in F$ such that $a \cdot b = 1$ 乘法反元素

(7) $\forall a, b, c \in F, a \cdot (b+c) = a \cdot b + a \cdot c$
乘法對加法分配律

Then we say F is a field.

Example $\mathbb{Z}_2 = \{0, 1\}$

+	0	1
0	0	1
1	1	0

·	0	1
0	0	0
1	0	1

Recall :

$\mathbb{F}^2: \mathbb{R}^2, \mathbb{C}^2$

$\mathbb{R}^n: \mathbb{R}^n, \mathbb{C}^n$

Span and Linear Independence

Recall :

A linear combination of vectors v_1, v_2, \dots, v_n is a vector of the form $a_1 v_1 + a_2 v_2 + \dots + a_n v_n$

$\mathbb{R}^2 : \mathbb{R}^2, \langle v_1, v_2 \rangle$

$\mathbb{R}^n : \mathbb{R}^n, \langle v_1, v_2, \dots, v_n \rangle$

$\text{span}(v_1, v_2, \dots, v_n) = \{ a_1 v_1 + a_2 v_2 + \dots + a_n v_n \mid a_i \in \mathbb{R} \}$

Example

If $\text{span}(v_1, v_2, v_3) = \mathbb{R}^3$ and $v_1 = (1, 2, 3), v_2 = (2, 3, 4), v_3 = (3, 4, 5)$

Example $\text{span}(v_1, v_2, v_3) = \mathbb{R}^3$ is NOT a linear combination of v_1, v_2, v_3

$\text{span}(v_1, v_2, v_3) = \mathbb{R}^3$

Solution

$$\begin{cases} 1x + 2y + 3z = 1 \\ 2x + 3y + 4z = 2 \\ 3x + 4y + 5z = 3 \end{cases}$$

Suppose $x_1, x_2, x_3 \in \mathbb{R}^3$

$(x_1, x_2, x_3) = x_1(1, 0, 0) + x_2(0, 1, 0) + x_3(0, 0, 1)$

$x_1(1, 0, 0) + x_2(0, 1, 0) + x_3(0, 0, 1) = (1, 2, 3)$

$\begin{cases} x_1 = 1 \\ x_2 = 2 \\ x_3 = 3 \end{cases}$
