1 Background on property testing

2 Cycle-freeness

3 A two-sided-error property tester for cycle-freeness

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

1 Background on property testing

2 Cycle-freeness

3 A two-sided-error property tester for cycle-freeness

- Try to answer "yes" or "no" for the following *relaxed* decision problems by observing only a small fraction of the input.
 - Does the input satisfy a designated property, or
 - is ϵ -far from satisfying the property?

- Try to answer "yes" or "no" for the following *relaxed* decision problems by observing only a small fraction of the input.
 - Does the input satisfy a designated property, or
 - is *ϵ*-far from satisfying the property?

- In property testing, we use ε-far to say that the input is far from a certain property.
- ϵ : the least fraction of the input needs to be modified.
- For example:
 - A sequence of integers L = (0, 2, 3, 4, 1).
 - Allowed operations: integer deletions
 - L is 0.2-far from being monotonically nondecreasing.

イロン イロン イヨン イヨン 三日

- In property testing, we use ε-far to say that the input is far from a certain property.
- ϵ : the least fraction of the input needs to be modified.
- For example:
 - A sequence of integers L = (0, 2, 3, 4, 1).
 - Allowed operations: integer deletions
 - *L* is 0.2-far from being monotonically nondecreasing.

The model for bounded-degree graphs

- Graph model: adjacency list for graphs with vertex-degree bounded by *d*.
 - It takes O(1) time to access to a function $f_G : [n] \times [d] \mapsto [n] \cup \{*\}.$
 - The value $f_G(v, i)$ is the *i*th neighbor of v or a special symbol '*' if v has less than *i* neighbors.
- ϵ -far from satisfying a graph property \mathbb{P} :
 - one has to modify > \epsilon dn entries in f_G (i.e., > \epsilon dn/2 edges) to make the input graph satisfy P.

- Graph model: adjacency list for graphs with vertex-degree bounded by *d*.
 - It takes O(1) time to access to a function $f_G : [n] \times [d] \mapsto [n] \cup \{*\}.$
 - The value $f_G(v, i)$ is the *i*th neighbor of v or a special symbol '*' if v has less than *i* neighbors.
- ϵ -far from satisfying a graph property \mathbb{P} :
 - one has to modify > \epsilon dn entries in f_G (i.e., > \epsilon dn/2 edges) to make the input graph satisfy P.

- The complexity measure: queries & running time.
- The complexity (say q(n, d, ε)) is asked to be sublinear in |V| = n.
 - $q(n, d, \epsilon) = o(f(n))$ if $\lim_{n \to \infty} \frac{q(n, d, \epsilon)}{f(n)} \to 0$, where ϵ and d are viewed as constants.

- The complexity measure: queries & running time.
- The complexity (say q(n, d, ε)) is asked to be sublinear in |V| = n.
 - $q(n, d, \epsilon) = o(f(n))$ if $\lim_{n \to \infty} \frac{q(n, d, \epsilon)}{f(n)} \to 0$, where ϵ and d are viewed as constants.

- A property tester for \mathbb{P} is an algorithm utilizing sublinear queries such that:
 - ▷ if the input satisfies \mathbb{P} : answers "yes" with probability $\geq 2/3$ (1 \rightarrow one-sided error);

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 めへで

8/34

▷ if the input is ϵ -far from satisfying \mathbb{P} : answers "no" with probability $\geq 2/3$.

Background on property testing (contd.)

- Unlike testing graph properties in the *adjacency-matrix model*, only a few, very simple graph properties are known to be testable (i.e., query complexity is independent of *n*).
- For most of nontrivial graph properties, super-constant lower bounds exist.
 - k-colorability:
 - **Ω**(**n**).
 - cycle-freeness: (We talk about it today)
 - $O(\frac{1}{\epsilon^3} + \frac{d}{\epsilon^2})$ (two-sided error);
 - $\Omega(\sqrt{n})$ (one-sided error).
 - having a vertex-cover of size ρn for a fixed $\rho > 0$:
 - **Ω**(**n**).

. . . .

- having a dominating set of size ρn for a fixed $\rho > 0$:
 - ?? (known to be **non-testable**).

1 Background on property testing

2 Cycle-freeness

3 A two-sided-error property tester for cycle-freeness

- A graph is cycle-free if it does not contain a cycle as a subgraph (or an induced subgraph).
- A connected graph with no cycles is a tree.
- A connected *n*-vertex graph with n 1 edges is a tree.
- An *n*-vertex graph with no cycles is a forest.
 - A forest has *n* − *k* edges (*k*: the number of components in the graph).

Using DFS, to determine if an *n*-vertex graph G has a cycle can be done in O(n) time.

1 Background on property testing

2 Cycle-freeness

3 A two-sided-error property tester for cycle-freeness

< □ > < □ > < □ > < Ξ > < Ξ > < Ξ > Ξ のQC 13/34 Algorithm: cycle-free-tester

Input: G = (V, E) in an adjacency-list with bounded-degree d, $0 < \epsilon < 1$.

- 1: Uniformly and independently select $\ell = 2^{13}/\epsilon^2$ vertices from V;
- 2: for each selected vertex s do
- 3: Perform a BFS starting from s until $\frac{8}{\epsilon d}$ vertices are reached or no more new vertices can be reached;
- 4: end for
- 5: if any of the above searches found a cycle then
- 6: Output REJECT;
- 7: end if
- 8: Let \hat{n} denote the number of vertices in the sample that belong to connected components of size $\geq \frac{8}{\epsilon d}$;
- 9: Let \hat{m} denote *half* the sum of their degrees;
- 10: if $\frac{\hat{m}-\hat{n}}{\ell} \geq \frac{\epsilon d}{16}$ then
- 11: Output REJECT;
- 12: else
- 13: Output ACCEPT;
- 14: end if

- Steps 1–7 (mainly BFS) totally takes time $O\left(\ell \cdot \frac{1}{\epsilon d} \cdot d\right) = O\left(\frac{1}{\epsilon^2} \cdot \frac{1}{\epsilon}\right) = O\left(\frac{1}{\epsilon^3}\right).$
- Steps 8–14 takes at most $\ell \cdot d = O\left(\frac{d}{\epsilon^2}\right)$ time.
 - Calculation of sum of degrees of the sampled ℓ vertices.

- If G is cycle-free, then each of its components is a tree.
- If G is e-far from being cycle-free, then it has many more edges within its components, where these edges (say superfluous edges) create cycles.

Rough ideas of the tester (contd.)

- If many superfluous edges reside in "small" components,
 - ⇒ many vertices are in these small components (∵ bounded degree).
 - ⇒ Uniformly select a large enough number of vertices, with high probability we catch such a vertex and then by performing a (bounded) search we can find a cycle.
- If many superfluous edges reside in "big" components, we cannot exhaustively search in such components.
 - For this case, we count the sampled *vertices* belonging to big components and and the *edges* incident them.
 - The *discrepancy* between such edge count and the vertex count is believed to be large.
 - This is due to that the number of big components is relatively small.

 - The *discrepancy* between such edge count and the vertex count is believed to be large.
 - This is due to that the number of big components is relatively small.

Before we proceed with the proof of correctness of the tester, let us see the following useful observations first.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 善臣 めへで

- A component is small (resp., big): it contains < ⁸/_{ϵd} vertices (resp., ≥ ⁸/_{ϵd} vertices).
- Some further notations:
 - *t*: the number of big components in *G*.
 - n': the number of vertices in big components in G.
 - m': the number of edges in big components in G.
 - Big: the set of vertices in big components in *G*.

Observation*

For any graph G, we have
$$\left|\frac{\hat{m}-\hat{n}}{\ell}-\frac{m'-n'}{n}\right| \leq \frac{\epsilon d}{16}$$
 with probability $\geq \frac{2}{3}$.

• We ignore the proof here.

- A component is small (resp., big): it contains < ⁸/_{ϵd} vertices (resp., ≥ ⁸/_{ϵd} vertices).
- Some further notations:
 - *t*: the number of big components in *G*.
 - n': the number of vertices in big components in G.
 - m': the number of edges in big components in G.
 - Big: the set of vertices in big components in *G*.

Observation*

For any graph G, we have
$$\left|\frac{\hat{m}-\hat{n}}{\ell}-\frac{m'-n'}{n}\right| \leq \frac{\epsilon d}{16}$$
 with probability $\geq \frac{2}{3}$.

• We ignore the proof here.

Next, we shall prove that cycle-free-tester achieves the following conditions:

- if G is cycle-free, then cycle-free-tester outputs ACCEPT with probability $> \frac{2}{3}$;
- if G is e-far from being cycle-free, then cycle-free-tester outputs REJECT with probability > ²/₃.

Algorithm: cycle-free-tester

Input: G = (V, E) in an adjacency-list with bounded-degree d, $0 < \epsilon < 1$.

- 1: Uniformly and independently select $\ell = 2^{13}/\epsilon^2$ vertices from V;
- 2: for each selected vertex s do
- 3: Perform a BFS starting from s until $\frac{8}{\epsilon d}$ vertices are reached or no more new vertices can be reached;
- 4: end for
- 5: if any of the above searches found a cycle then
- 6: Output REJECT;
- 7: end if
- 8: Let \hat{n} denote the number of vertices in the sample that belong to connected components of size $\geq \frac{8}{\epsilon d}$;
- 9: Let \hat{m} denote *half* the sum of their degrees;
- 10: if $\frac{\hat{m}-\hat{n}}{\ell} \geq \frac{\epsilon d}{16}$ then
- 11: Output REJECT;
- 12: else
- 13: Output ACCEPT;
- 14: end if

• cycle-free-tester never outputs REJECT in Step 6.

$$m'-n'=-t\leq 0.$$

- Recall that with probability $\geq 2/3$, the inequality $\left|\frac{\hat{m}-\hat{n}}{\ell}-\frac{m'-n'}{n}\right| \leq \frac{\epsilon d}{16}$ holds.
- The inequality $(\hat{m} \hat{n})/\ell < \epsilon d/16$ holds with probability $\geq 2/3$, thus the algorithm accepts G in Step 13 with probability $\geq 2/3$.

- For a graph G with t connected components, n vertices and m edges, we define $m (n t) \ge 0$ to be the number of superfluous edges in G.
- *G* is ϵ -far from being cycle-free \Rightarrow the number of superfluous edges $\geq \frac{1}{2}\epsilon dn$.

23/34

Let us consider two cases:

Consider a small component having *s* superfluous edges.

• This component must contain $\geq \frac{2s}{d}$ vertices.

- The total number of vertices in small components that contain superfluous edges $\geq \epsilon n/2$.
- Hence, no cycle is detected in Step 2 with probability $<(1-\epsilon/2)^\ell<1/3.$

Recall that

- *t*: the number of big components;
- n': the number of vertices in big components;
- m': the number of edges in big components.

•
$$m' - (n' - t) \geq \frac{\epsilon dn}{4}$$

Recall that with probability $\geq 2/3$, the inequality $\left|\frac{\hat{m}-\hat{n}}{\ell}-\frac{m'-n'}{n}\right| \leq \frac{\epsilon d}{16}$.

•
$$\frac{\hat{m}-\hat{n}}{\ell} > \frac{\epsilon d}{16}$$
 with probability $\geq 2/3$.

• Thus the algorithm returns REJECT in Step 11 with probability $\geq 2/3$.

Thank you,

and

Happy Teachers' Day!

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

■ For i = 1,..., ℓ, let χ_i be a 0-1 random variable that equals 1 iff the *i*th selected vertex (say, v_{ki}) belongs to Big.

$$\hat{n} = \sum_{i=1}^{\ell} \chi_i.$$

$$\mathbf{E}[\chi_i] = \sum_{v_{k_i} \in \mathsf{Big}} 1 \cdot \mathbf{Pr}[v_{k_i} \text{ is selected}] = n' \cdot \frac{1}{n} = \frac{n'}{n}.$$

$$\mathbf{E}[\hat{n}] = \frac{n'\ell}{n}.$$

Some useful Chernoff bounds:

• Let $X_1, X_2, ..., X_n$ be a series of *mutually independent* Bernoulli random variables with $S = \sum_{i=1}^n X_i$ and $\mu = \mathbf{E}[S]$. Assume that, for all *i*, $\mathbf{Pr}[X_i = 1] = p$ for some p > 0, then

$$\begin{split} &\mathsf{Pr}[S \geq (1+\delta)\mu] &\leq \quad \left(\frac{e^{\delta}}{(1+\delta)^{(1+\delta)}}\right)^{\mu}, \text{ for any } \delta > 0; \\ &\mathsf{Pr}[|S-\mu| \geq \delta\mu] &\leq \quad 2e^{-\mu\delta^2/3} \text{ for } \delta \in (0,1). \end{split}$$

Applying the Chernoff bound below:

$$\begin{aligned} & \mathbf{Pr}\left[\left|\frac{\hat{n}}{\ell} - \frac{n'}{n}\right| \geq \frac{\epsilon}{32}\right] &\leq & \mathbf{Pr}\left[\left|\hat{n} - \frac{n'}{n} \cdot \ell\right| \geq \frac{\epsilon}{32} \cdot \ell\right] \\ & \leq & \mathbf{Pr}\left[\left|\hat{n} - \frac{n'}{n} \cdot \ell\right| \geq \left(\frac{\epsilon}{32} \cdot \frac{n}{n'}\right) \cdot \frac{n'}{n} \cdot \ell\right] \\ & \leq & 2e^{-\frac{1}{3} \cdot \frac{n'}{n} \cdot \ell \cdot \left(\frac{\epsilon n}{32n'}\right)^2} \text{ (note that } \ell = 2^{13}/\epsilon^2) \\ & \leq & 2 \cdot e^{-8/3} \\ & < & \frac{1}{6}. \end{aligned}$$

• Thus with probability $\geq 5/6$, we have $\left|\frac{\hat{n}}{\ell} - \frac{n'}{n}\right| < \frac{\epsilon}{32}$.

< □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ 29 / 34

Proof of Observation* (contd.)

■ Similarly, for i = 1,..., ℓ let φ_i be a random variable that equals the degree of the *i*th selected vertex if it belongs to a big component, and 0 otherwise.

(日) (四) (三) (三) (三)

• Then
$$\hat{m} = \frac{1}{2} \sum_{i=1}^{\ell} \phi_i$$
, and $\mathbf{E}[\hat{m}] = \frac{m'\ell}{n}$.
• $\mathbf{E}[\phi_i] = \sum_{\mathbf{v}_{k_i} \in \text{Big}} d(\mathbf{v}_{k_i}) \cdot \mathbf{Pr}[\mathbf{v}_{k_i} \text{ is selected}] = 2m' \cdot \frac{1}{n}$.
• Note that $0 \le \phi_i \le d$ for each i .

A Hoeffding's bound:

 Let X₁, X₂,..., X_n be a series of mutually independent bounded Bernoulli random variables (i.e., a_i ≤ X_i ≤ b_i, for some positive real a_i and b_i), then for α > 0

$$\mathbf{Pr}[|S-\mu| \ge \alpha] \le 2e^{-2\alpha^2 / \sum_{i=1}^n (b_i - a_i)^2}.$$

<ロ> <四> <四> <四> <三</p>

Proof of Observation* (contd.)

Applying the previous Hoeffding's bound below:

$$\Pr\left[\left|\frac{\hat{m}}{\ell} - \frac{m'}{n}\right| \ge \frac{\epsilon d}{32}\right] = \Pr\left[\left|\hat{m} - \frac{m'\ell}{n}\right| \ge \frac{\epsilon d\ell}{32}\right]$$
$$\le 2e^{-\frac{2\cdot\left(\frac{\epsilon d\ell}{32}\right)^2}{\ell \cdot d^2}}$$
$$= 2e^{-\frac{2\cdot\frac{2\cdot d^2 \cdot \ell^2}{2^{10}}}{\ell \cdot d^2}}$$
$$= 2e^{-\frac{e^{2\cdot\frac{2\cdot d^2}{2^{10}}}}{2^{9}}}$$
$$= 2e^{-16}$$
$$< \frac{1}{6}.$$

Thus with probability $\geq 5/6$, we have $\left|\frac{\hat{m}}{\ell} - \frac{m'}{n}\right| < \frac{\epsilon d}{32}$.

Here we have:

- With probability $\geq 5/6$, we have $\left|\frac{\hat{n}}{\ell} \frac{n'}{n}\right| < \frac{\epsilon}{32}$ (say (i)), and
- With probability $\geq 5/6$, we have $\left|\frac{\hat{m}}{\ell} \frac{m'}{n}\right| < \frac{\epsilon d}{32}$ (say (ii)).

 $\Pr[(i) \text{ or } (ii) \text{ is not satisfied}] < \frac{1}{3}.$

Thus with probability $\geq 2/3$, the inequality $\left|\frac{\hat{m}-\hat{n}}{\ell} - \frac{m'-n'}{n}\right| \leq \frac{\epsilon d}{16}$ holds.

Thank you,

and
